ANISH VIJAYVERGIA

9321503162 | anishmvijayvergia@gmail.com| Mumbai | github.com/anish119| linkedin.com/in/anishvijayvergia

EDUCATION

B.E. Computer Science Engineering (IoT, Cybersecurity & Blockchain) | Lokmanya Tilak College of Engineering, Mumbai | 2026

K M Agrawal College | HSC | 2020-2022

Smt K C Gandhi English School | SSC | 2008-2020

WORK EXPERIENCE

Project Intern | Sunrich Technologies Pvt Ltd | Mumbai | June 2024 – September 2024

- Developed backend modules for a File Store Management System using Java and Spring Boot, implementing secure user authentication and session-based login
- Built file upload functionality with structured storage and retrieval logic using MySQL, enabling users to search and access documents by name
- Collaborated in a team environment to integrate backend APIs supporting core file management operations across the web application

PROJECTS

1) **SafeHire** | Next.js, TypeScript, PostgreSQL | safe-hire.in
   - Built a privacy-preserving identity verification system using Zero-Knowledge Proof authentication integrated with Aadhaar OCR, enabling secure background checks without exposing raw personal data
   - Processed and indexed India's corporate registry dataset using streaming parsing, enabling real-time company legitimacy checks at scale
   - Designed tamper-proof certificate verification using SHA-256 hashing to ensure issued credential integrity
2) **Voices Unchained** | Ethereum(sepolia), Hardhat, MongoDB | voices-unchained.vercel.app
   - Developed blockchain-based incident reporting workflow ensuring tamper-proof storage of submitted case records
   - Deployed and tested contract interaction workflows using Hardhat local Ethereum development environment
   - Implemented role-based access control enabling controlled communication between users and investigators
3) **Driver Drowsiness Detection System** | Python, OpenCV, Mediapipe | github.com/anish119/Drowsiness
   - Built a real-time driver fatigue detection system using Mediapipe's 468-point face mesh, achieving ~90% landmark detection accuracy on standard webcam input
   - Implemented Eye Aspect Ratio (EAR) based drowsiness logic triggering an automated audio alert within ~1–2 seconds of detecting prolonged eye closure
   - Designed for low-latency inference using OpenCV, suitable for deployment on resource-constrained edge devices
4) **Song Recommendation System** | Python, Machine Learning | github.com/anish119/Song-recommendation-System
   - Built a content-based music recommendation engine using a pre-computed cosine similarity matrix, integrated with the Spotify API to fetch real-time album art and direct playback links
   - Developed an interactive web interface using Streamlit where users select a song from a dropdown and receive 5 similar song recommendations with album covers

TECHNICAL SKILLS

- **Languages**: Python, Java, HTML, Solidity, CSS
- **Technologies:** Blockchain, Smart Contracts, Machine Learning, MongoDB, MySQL, PostgreSQL, REST APIs, OpenCV, Mediapipe, Hardhat
- **Cybersecurity:** Network Security Fundamentals, Kali Linux, Burp Suite
- **Tools:** Git, Android Studio, VS Code, IntelliJ IDEA, Jupyter Notebook

CO-CURRICULAR ACTIVITIES

- **Management Head, CSESA**: Organized 15+ technical events including 2 national-level events
- **Technical Team Member, Zypher**: Organized Escape Room event, RC-Car track setup and 3D Printing workshop
- **Founder, Itefaq Clothing Brand**: Led branding, coordinated with designers, and managed creative communication for a streetwear startup
